Exam 1: Javascript

Create a shopping cart object. Your object should have at the minimum the following properties and method.

Object Properties:

First Name
Last Name
Array of cart items purchased (there must be a minimum of two items in the cart array)

Object Method:

printShoppingCart() – a method of the object which displays all the items ordered, the price of the item and a final total. Your method should be using a looping construct to display each item.

You can add additional methods and properties if you feel they are needed. You may hard code in all the property values. All that should be required to test the object is to run the object's method:

E.g.

objectName.printShoppingCart()

Expected Output:

Name: Lou Tennant
Items Purchased:
Rubber Duck $15.95
Stitch Erase $1.95
Total Purchase: $17.90
